Amendment dated: 11-JUL-2006

Response to Office Action of 04/11/2006

AMENDMENTS TO THE CLAIMS

Please amend claims 1, 2, 8 and 9, as set forth in the listing of claims that follows:

Listing of Claims

An apparatus for measuring a cinching tension on a 1. (currently amended) child seat placed on a bottom cushion of a vehicle seat, said vehicle seat having a pressure sensor disposed therein operative to monitor the weight of an occupant and provide an occupant weight output signal to an occupant detection system electronic control unit, said child seat having first and second tether straps affixed thereto for cinching said child seat to said vehicle seat independently of an occupant restraining seat belt system associated with said vehicle seat, said apparatus comprising:

first and second laterally spaced child seat anchor brackets stradding straddlings said child seat in proximity to said bottom cushion, said first and second child seat anchor brackets being adapted to tensively secure said first and second tether straps to said vehicle seat, respectively;

an anchor frame extending across a lateral width dimension of the vehicle seat and secured to a frame of the vehicle seat; and

a first tension sensor securing said first child seat anchor bracket to a first end of said anchor frame, and a second tension sensor means securing said second child seat anchor bracket to a second end of said anchor frame, said first and second tension sensors each sensor providing a discrete an output signal to said occupant detection system electronic control unit.

3

Amendment dated: 11-JUL-2006

Response to Office Action of 04/11/2006

2. (currently amended) The apparatus of Claim 1, wherein each of said first and second tension sensors sensor includes a first portion rigidly secured to said anchor frame and a second portion integral with a respective child seat anchor bracket.

3. (withdrawn) Apparatus for measuring tension exerted on a child seat anchor bracket of a vehicle seat, comprising:

an anchor frame rigidly secured to the anchor bracket, and secured to a frame of the vehicle seat; and

a tension sensor including a first portion coupled to said anchor frame and a second portion coupled to the seat frame.

- 4. (withdrawn) The apparatus of Claim 3, wherein said anchor frame is secured to the seat frame by a pivot coupling, and the first portion of said sensor is coupled to said anchor frame between said pivot joint and said anchor bracket.
- 5. (withdrawn) The apparatus of Claim 3, wherein said anchor frame extends laterally across said seat, and first and second child seat anchor brackets are rigidly secured to laterally opposite ends of said anchor frame such that said first and second anchor brackets are disposed in a gap between back and bottom cushions of said seat.
- 6. (withdrawn) The apparatus of Claim 5, wherein the first portion of said sensor is coupled to said anchor frame at a point intermediate said first and second child seat anchor brackets.

Amendment dated: 11-JUL-2006

Response to Office Action of 04/11/2006

The apparatus of Claim 6, wherein said anchor frame is 7. (withdrawn) secured to the seat frame by a pivot coupling, and the first portion of said sensor is coupled to said anchor frame at a point intermediate said pivot joint and said anchor brackets.

In a vehicle seat assembly including a generally 8. (currently amended) vertically disposed back cushion, a seat portion including a generally horizontally disposed bottom cushion and carried upon a seat frame, pressure sensor means disposed within said seat portion operative to monitor the weight of an occupant and provide an occupant weight output signal to an occupant detection system electronic control unit, and an occupant restraining seat belt, an apparatus for measuring a cinching tension exerted on a child seat disposed on said bottom cushion, said child seat having a plurality of tether straps for cinching said child seat to said vehicle seat assembly, said apparatus comprising:

a plurality of laterally spaced child seat anchor brackets straddling said child seat, each anchor bracket extending-through a juncture gap between the back and bottom eushions and adapted to tensively secure a corresponding tether strap affixed to said child seat; and

a tension sensor mountingly coupled between said seat frame and at least one of said child seat anchor brackets, said tension sensor operative to provide a tension sensor output signal to said occupant detection system electronic control unit.

The apparatus of Claim 8, wherein said occupant 9. (currently amended) detection system electronic control unit is operative to generate a vehicle restraint actuation an output signal as a function of said occupant weight output signal and said tension sensor output signal.

Amendment dated: 11-JUL-2006

Response to Office Action of 04/11/2006

- The apparatus of Claim 8, further comprising an anchor 10. (original) frame mechanically interconnecting said seat frame and said tension sensor.
- The apparatus of Claim 10, wherein said anchor frame is 11. (original) rigidly affixed to said seat frame.
- The apparatus of Claim 10, wherein said anchor frame is 12. (withdrawn) secured to said seat frame by a pivot coupling.
- The apparatus of Claim 10, wherein said anchor frame 13. (original) defines a pocket area for nestingly receiving and securing said tension sensor therein.
- The apparatus of Claim 13, wherein said pocket area is 14. (original) integrally formed adjacent one lateral end of said anchor frame.
- The apparatus of Claim 10, wherein said anchor frame 15. (original) defines surface contours therein to enhance characteristic stiffness of said anchor frame.
- The apparatus of Claim 15, wherein said surface contours 16. (original) are integrally formed in said anchor frame as a plurality of laterally spaced depressions therein.
- 17. (original) The apparatus of Claim 8, wherein said apparatus comprises a plurality of tension sensors, one tension sensor associated with each child seat anchor bracket.

Amendment dated: 11-JUL-2006

Response to Office Action of 04/11/2006

- 18. (original) The apparatus of Claim 17, wherein each said tension sensor is operative to provide an associated tension sensor output signal to said occupant detection system electronic control unit.
- 19. (original) The apparatus of Claim 10, wherein said apparatus comprises a tension sensor associated with each said child seat anchor bracket, each of said tension sensors including a first portion rigidly secured to said anchor frame and a second portion integral with a corresponding child seat anchor bracket.
- 20. (withdrawn) The apparatus of Claim 8, further comprising: an anchor frame rigidly secured to each anchor bracket, and secured to the seat frame,

said tension sensor including a first portion coupled to said anchor frame and a second portion coupled to the seat frame.

- 21. (withdrawn) The apparatus of Claim 20, wherein said anchor frame is secured to the seat frame by a pivot coupling, and the first portion of said sensor is coupled to said anchor frame between said pivot joint and said anchor bracket.
- 22. (withdrawn) The apparatus of Claim 20, wherein said anchor frame extends laterally across said seat, and each child seat anchor brackets is rigidly secured to laterally opposite ends of said anchor frame such that each of said anchor brackets are at least partially disposed in said juncture gap between back and bottom cushions of said vehicle seat.

Amendment dated: 11-JUL-2006

Response to Office Action of 04/11/2006

The apparatus of Claim 22, wherein the first portion of said 23. (withdrawn) sensor is coupled to said anchor frame at a point intermediate first and second child seat anchor brackets.

The apparatus of Claim 23, wherein said anchor frame is 24. (withdrawn) secured to the seat frame by a pivot coupling, and the first portion of said sensor is coupled to said anchor frame at a point intermediate said pivot joint and said anchor brackets.
